# Granular Authorization with Authority

# Role vs Authority

Roles represent high-level, permissions that are typically associated with a group of users. For example, “USER”, “ADMIN”, “MANAGER” etc.

Authorities, also known as privileges or permissions, represent fine-grained access rights within an application. For example, different authorities can be defined to allow users to “CREATE”, “UPDATE” AND “DELETE” a particular resource.

POST\_CREATE, POST\_UPDATE, POST\_DELETE,  
BLOG\_CREATE, BLOG\_UPDATE, BLOG\_DELETE
